

**STATISTICS WORKSHEET-3**

**Q1 to Q9 have only one correct answer. Choose the correct option to answer your question.**

1. Which of the following is the correct formula for total variation?
- a) Total Variation = Residual Variation – Regression Variation
  - b) Total Variation = Residual Variation + Regression Variation
  - c) Total Variation = Residual Variation \* Regression Variation
  - d) All of the mentioned

ANS- b) Total Variation = Residual Variation + Regression Variation

2. Collection of exchangeable binary outcomes for the same covariate data are called \_\_\_\_\_ outcomes.
- a) random
  - b) direct
  - c) binomial
  - d) none of the mentioned

ANS- a) random

3. How many outcomes are possible with Bernoulli trial?
- a) 2
  - b) 3
  - c) 4
  - d) None of the mentioned

ANS- a) 2

4. If  $H_0$  is true and we reject it is called
- a) Type-I error
  - b) Type-II error
  - c) Standard error
  - d) Sampling error
  - e) ANS- a) Type - I error

5. Level of significance is also called:
- a) Power of the test
  - b) Size of the test
  - c) Level of confidence
  - d) Confidence coefficient
  - e) ANS – a) Power of the test

6. The chance of rejecting a true hypothesis decreases when sample size is:
- a) Decrease
  - b) Increase
  - c) Both of them
  - d) None
- ANS- b) Increase

7. Which of the following testing is concerned with making decisions using data?
- a) Probability
  - b) Hypothesis
  - c) Causal
  - d) None of the mentioned
  - e) ANS- b) Hypothesis

8. What is the purpose of multiple testing in statistical inference?
- a) Minimize errors
  - b) Minimize false positives
  - c) Minimize false negatives
  - d) All of the mentioned
- e) ANS – a) Minimize errors

9. Normalized data are centred at \_\_\_\_ and have units equal to standard deviations of the original data

- a) 0
- b) 5
- c) 1
- d) 10

ANS- a) 0

**Q10 and Q15 are subjective answer type questions, Answer them in your own words briefly.**

10. What Is Bayes' Theorem?

ANS- Bayes' Theorem states that the conditional probability of an event, based on the occurrence of another event, is equal to the likelihood of the second event given the first event multiplied by the probability of the first event.

11. What is z-score?

ANS- It indicates how many standard deviations an element is from the mean. Hence, Z-Score is measured in terms of standard deviation from the mean. For example, a standard deviation of 2 indicates the value is 2 standard deviations away from the mean.

12. What is t-test?

ANS- The t-test is a test that is mainly used to compare the mean of two groups of samples. It is meant for evaluating whether the means of the two sets of data are statistically significantly different from each other.

13. What is percentile?

ANS- a percentile is a term that describes how a score compares to other scores from the same set. While there is no universal definition of percentile, it is commonly expressed as the percentage of values in a set of data scores that fall below a given value.

14. What is ANOVA?

ANS- Analysis of variance (ANOVA) is a collection of statistical models and their associated estimation procedures (such as the "variation" among and between groups) used to analyze the differences among means. ANOVA was developed by the statistician Ronald Fisher.

15. How can ANOVA help?

ANS- ANOVA is helpful for testing three or more variables. It is similar to multiple two-sample t-tests. However, it results in fewer type I errors and is appropriate for a range of issues. ANOVA groups differences by comparing the means of each group and includes spreading out the variance into diverse sources.
