MACHINE LEARNING

Q1 to Q11 have only one correct answer. Choose the correct option to answer your question.

1. Movie Recommendation systems are an example of:
   i) Classification
   ii) Clustering
   iii) Regression
   Options:
   a) 2 Only
   b) 1 and 2
   c) 1 and 3
   d) 2 and 3
   ANS- d) 2 and 3

2. Sentiment Analysis is an example of:
   i) Regression
   ii) Classification
   iii) Clustering
   iv) Reinforcement
   Options:
   a) 1 Only
   b) 1 and 2
   c) 1 and 3
   d) 1, 2 and 4
   ANS – 1,2, and 4

3. Can decision trees be used for performing clustering?
   a) True
   b) False
   ANS- a) True

4. Which of the following is the most appropriate strategy for data cleaning before performing clustering analysis, given less than desirable number of data points:
   i) Capping and flooring of variables
   ii) Removal of outliers
   Options:
   a) 1 only
   b) 2 only
   c) 1 and 2
   d) None of the above
   ANS- a) 1 only

5. What is the minimum no. of variables/ features required to perform clustering?
   a) 0
   b) 1
   c) 2
   d) 3
   ANS- B) 1

6. For two runs of K-Mean clustering is it expected to get same clustering results?
   a) Yes
   b) No
   ANS – B) No

FLIP ROBO

<u>MACHINE LEARNING</u>

7. Is it possible that Assignment of observations to clusters does not change between successive iterations in K-Means?
   a) Yes
   b) No
   c) Can't say
   d) None of these

   ANS- a) Yes

MACHINE LEARNING

8. Which of the following can act as possible termination conditions in K-Means?
   i) For a fixed number of iterations.
   ii) Assignment of observations to clusters does not change between iterations. Except for cases witha bad local minimum.
   iii) Centroids do not change between successive iterations.
   iv) Terminate when RSS falls below a threshold.
   Options:
   a) 1, 3 and 4
   b) 1, 2 and 3
   c) 1, 2 and 4
   d) All of the above
   ANS- d) All of the above

9. Which of the following algorithms is most sensitive to outliers?
   a) K-means clustering algorithm
   b) K-medians clustering algorithm
   c) K-modes clustering algorithm
   d) K-medoids clustering algorithm
   e) ANS – a) K-means clustering algorithm

10. How can Clustering (Unsupervised Learning) be used to improve the accuracy of Linear Regression model (Supervised Learning):
    i) Creating different models for different cluster groups.
    ii) Creating an input feature for cluster ids as an ordinal variable.
    iii) Creating an input feature for cluster centroids as a continuous variable.
    iv) Creating an input feature for cluster size as a continuousvariable.
    Options:
    a) 1 only
    b) 2 only
    c) 3 and 4
    d) All of the above
    ANS – d) all of the above

11. What could be the possible reason(s) for producing two different dendrograms using agglomerative clustering algorithms for the same dataset?
    a) Proximity function used
    b) of data points used
    c) of variables used
    d) All of the above
    ANS – D) All of the above

Q12 to Q14 are subjective answers type questions, Answers them in their own words briefly

12. Is K sensitive to outliers?

ANS – **The k-means algorithm is sensitive to the outliers**. In this paper, we propose a robust two-stage k-means clustering algorithm based on the observation point mechanism, which can accurately discover the cluster centers without the disturbance of outliers.

13. Why is K means better?
ANS-

- Relatively simple to implement.

MACHINE LEARNING

- Scales to large data sets.

- Guarantees convergence.

- Can warm-start the positions of centroids.

- Easily adapts to new examples.

- Generalizes to clusters of different shapes and sizes, such as elliptical clusters.

14. Is K means a deterministic algorithm?

ANS - The **non-deterministic** nature of K-Means is due to its random selection of data points as initial centroids. Method: We propose an improved, density based version of K-Means, which involves a novel and systematic method for selecting initial centroids.
